SUMMARY

Applied AI systems builder and Production Support Engineer with 6+ years of experience solving complex operational problems through investigation, workflow design, automation, and cross-functional collaboration. Experienced in designing AI-assisted operational platforms that connect teams, systems, and workflows across the incident lifecycle. Skilled at identifying organizational bottlenecks, translating business needs into technical solutions, and leveraging AI to improve operational efficiency, investigation quality, and decision-making. Combines deep production-support expertise with hands-on experience building AI-powered workflow orchestration and investigation platforms using Kiro and Cursor.

EXPERIENCE

Production Support Engineer 2019–Present

ConnectiveRx

- Investigate and resolve complex production issues through debugging, root cause analysis, SQL investigation, API troubleshooting, and cross-functional collaboration.
- Analyze AWS services including CloudWatch, DynamoDB, Lambda, and S3 to support operational troubleshooting and service reliability.
- Designed and built PSA (Production Support Assistant), an internal AI-assisted operational platform focused on workflow orchestration, operational reasoning, investigation support, and enterprise troubleshooting workflows.
- Leveraged Kiro and Cursor to accelerate development of AI-assisted workflows, operational tooling, Microsoft-based SSO authentication, and investigation automation capabilities — designing the underlying architecture, prompts, and reasoning logic personally.
- Developed operational tooling concepts spanning investigation workflows, confidence modeling, tool discovery, escalation management, and AI-assisted decision support.
- Presented platform capabilities directly to a 35-person executive audience spanning the full C-suite (CEO, CTO, COO, CPO, CCO, CISO, and other senior leaders), generating interest in broader organizational adoption and future integrations.
- Provide knowledge transfer, team training, and operational guidance to support onboarding and continuous improvement efforts.

Web Developer 12/2017–12/2019

Ufeis, Yonkers, NY

- Planned and built website features end-to-end, converting design mockups into production-ready interfaces using HTML, CSS, Bootstrap, MySQL, and PHP.
- Built multi-role login systems integrated with MySQL via Google Charts and DataTables APIs, and managed testing, debugging, and deployment for client sites.

PROJECTS

PSEA (Production Support Engineer Agent) | *AI-assisted operational investigation and workflow orchestration platform designed to guide work across Operations, Production Support, and Development teams*

- Designed and built an AI-assisted platform that supports issue investigation, workflow continuity, escalation management, and operational decision support across multiple organizational functions.
- Developed reasoning-driven workflows that help teams investigate issues, surface relevant tools and knowledge, recommend next actions, and maintain context throughout the issue lifecycle.
- Built human-in-the-loop workflows with governance controls, operational guardrails, and escalation pathways.
- Implemented OAuth-based authentication and secure access controls, and deployed/operated the platform on AWS using App Runner, Bedrock, Postgres/RDS, and Redis.
- Used Cursor and Kiro to accelerate implementation, while independently designing the platform's architecture, agentic workflows, prompts, and governance model.
- Live demonstration available upon request.

TECHNICAL SKILLS

Applied AI & Agentic Systems: AI Workflow Orchestration, Agentic Workflows, Operational Intelligence, Human-in-the-Loop Systems, Kiro, Cursor

Operations & Investigation: Root Cause Analysis, Incident Investigation, SQL, API Debugging

Cloud & Infrastructure: AWS (CloudWatch, DynamoDB, Lambda, S3, App Runner, Bedrock, RDS/Postgres, Redis), OAuth Authentication, Microsoft SSO

Collaboration & Tools: Cross-Functional Leadership, Platform Design, Operational Automation, PHP, Jira, Git, GitHub
